Instruction for setting up VPN on Win7

Open Internet Explorer or Firefox – in the address bar, type https://164.58.104.10 and press enter. The following will display:

In Internet Explorer, you will need to setup this as a trusted site. Open IE -- on the tool bar click Tools, Internet Options then click the Security tab.

Then Click the Sites button – add this website to the zone – the https://164.58.104.10 should appear then click the “Add” button and click close.

Back on the web page, click “Continue to this website.” Ignore the warning “not recommended.”
The following screen will appear. Sign in using your normal network logon – this will take you to the install wizard.

You may see an Active-X control install in a yellow strip. Install and follow the wizard. On the Security Alert (shown below) click **YES** (you may see this more than once).
Once the installation is complete, you will find in the Start button > Programs, a group named Cisco with a subgroup item labeled “Cisco AnyConnect VPN Client.” Right-click this subgroup item and create a desktop shortcut.

![Desktop Shortcut](image)

Double click the shortcut which you put on the desktop. **Note:** You may see the “Security Alert” warning again. If you do, click YES to continue.

![Security Alert](image)

Enter your id and password in the appropriate spaces. Click the “Connect” button.
The pesky security alert dialog box which may appear several times. Always click “Yes” to continue.

Once connected, an icon will appear in your task tray. You can proceed to remote desktop to your station here on campus.

When you are ready to end the remote session, Log off. You will then need to end the VNP session: Right select “disconnect.” The lock appears unlocked – right click the icon again then select quit.
